ABSTRACT

SUSTRINA, BRIAN ANGELO R. Farmers' Awareness and Management of Coffee Insect Pests and their Natural Enemies in Selected Areas of Upland Cavite. Undergraduate Thesis. Bachelor of Science in Agriculture Major in Crop Science. Cavite State University, Indang, Cavite. June 2019. Adviser: Dr. Evelyn O. Singson.

The study was conducted from March to April 2019 in Alfonso, Amadeo, and Silang, Cavite to: 1. describe the socio-demographic characteristics (age, sex, educational attainment, annual income from coffee farming, and number of years engaged in coffee farming) of the coffee farmers in Alfonso, Amadeo, and Silang, Cavite; 2. determine their level of awareness on coffee insect pests and their natural enemies; 3. determine the relationship between the socio-demographic characteristics of the participants and their level of awareness on coffee insect pests and their natural enemies; 4. compare the level of awareness of the participants per municipality to coffee insect pests and their natural enemies; 5. determine the insect pest management practices adopted by the participants; and 6. identify the sources of information of participants regarding their adopted insect pest management practices.

Descriptive correlational research design was employed in the study. The list of coffee farmers was obtained from the Office of Municipal Agriculturist in Alfonso, Amadeo, and Silang, Cavite. Interviews with participants were done through the use of survey questionnaires and brochures containing colored photographs of insects associated with coffee production.

A typical Caviteño coffee farmer is 64 years old. Most of the coffee farmers are male (71%), were able to reach college (47%), and have been engaged in coffee farming for an average of 37 years. Moreover, almost half of the farmer participants (44%) did

not earn any income at all from this year's coffee harvest. In general, majority of the participants are moderately aware ($\bar{x} = 3.01$) of the insects related with coffee production. The participants are aware ($\bar{x} = 3.97$) of the presence of coffee insect pests but are slightly aware ($\bar{x} = 2.04$) of the presence of their natural enemies. Farmers with higher income tend to have higher level of awareness ($P = .016$) on insects associated to coffee production. Moreover, participants from different municipalities have the same level of awareness ($P = 0.174$) on insects associated with coffee production. Insect pest management practices such as planning of production schedules, crop rotation, intercropping, collection of berries remaining on trees and after harvest, pruning of dried-up branches and for shade regulation, sun-drying of coffee beans, and weeding are being implemented by all of the participants. Farmers source information regarding their adopted insect pest management practices from relatives, friends, own experience, journals, forums and agricultural supply stores. In addition, the farmers' own experience (100%) is found to be the highest contributory factor in choosing their adopted insect pest management practices.

FARMERS' AWARENESS AND MANAGEMENT OF COFFEE INSECT PESTS AND THEIR NATURAL ENEMIES IN SELECTED AREAS OF UPLAND CAVITE

Brian Angelo R. Sustrina

An undergraduate thesis manuscript submitted to the Faculty of the Department of Crop Science, College of Agriculture, Food, Environment, and Natural Resources, Cavite State University, Indang, Cavite in partial fulfillment of the requirements for the degree of Bachelor of Science in Agriculture major in Crop Science with Contribution No. BSA 2019-05. Prepared under the supervision of Dr. Evelyn O. Singson.

INTRODUCTION

Coffee is considered to be a high-value crop in both the local and foreign markets (Philippine Crop Insurance Corporation, n.d.). It ranks second to oil as the most valuable commodity and next to tea and water as the most popular beverage in the world (Bae, Park, Im, & Song, 2014; Stone, 2014). However, the Philippines, despite having favorable agro-climatic condition for the growth and development of coffee trees, cannot sustain the demand for coffee based on the report that the country's self-sufficiency ratio was only about 31.89 percent (Philippine Statistics Authority [PSA], 2016) This low self-sufficiency ratio can be attributed to the presence of different pests and diseases, old and less productive trees, and the dreaded climate change (Mambule, 2018).

Crop losses due to pests and diseases are a major threat, especially today that the world is experiencing climate change. According to Deutsch *et al.* (2018), warmer climate tends to increase the metabolic rate of insects, which in turn make the insects
