ABSTRACT

ANGUE, JOHN GLENDLE A., GANCIOSO, JOELA C., RANADA, RICA MAE A., and ROLL, BRYAN ALLEN I. Development of Cavite PUV Fare and Navigation System using Cognitive Ergonomics. Undergraduate Thesis. Bachelor of Science in Industrial Engineering. Cavite State University, Indang, Cavite. June 2019. Adviser: Engr. Gerry M. Castillo.

This study was conducted from August 2018 to April 2019 in all municipalities/cities of Cavite which aimed to develop a PUV fare and navigation mobile application using cognitive ergonomics. Specifically, the study aimed to: 1.) determine the current situation of fare system in Cavite; 2.) determine the problems encountered in the fare system; 3.) design and develop a fare and navigation application using cognitive ergonomic criteria and industrial engineering tools; 4.) test and evaluate the developed Cavite PUV fare and navigation mobile application; and 5.) provide possible recommendations that can improve the fare system in Cavite.

Descriptive and developmental research were used in the study and Define, Measure, Analyze, Design and Verify (DMADV) method was followed as its research methodology. The primary sources of data were the data coming from the fare matrix issued by the Land Transportation Franchising Regulatory Board (LTFRB), tariff from all municipalities/cities in the province and survey questionnaires while the secondary sources were the data coming from some books, journals and articles as well as the data coming from the internet that supports the findings of the study that were related in cognitive ergonomics, transportation, fare and mobile application design. Slovincs formula and Stratified random sampling technique were used to determine the number of participants in the study. A total of 400 respondents in different municipalities and cities were the participants of the study.

The identified problems in the study using survey questionnaire were insufficient fare matrix posted in every Public Utility Vehicles (PUVs), unreliable and incomplete fare information at Cavite, unavailability of fare information when searching online, lack of awareness on the current situation of the fare system in the province, experience paying an overpriced fare and difficulty in seeking information about fares. These problems were categorized in information management, communication problems and time consuming.

After identifying the problems that were encountered by the respondents, the researchers designed and developed a mobile application using the gathered problems and ergonomic criteria. In terms of the ergonomic quality and usability of the application, it yields a level of excellence from the respondents, and achieved the effectiveness, and efficiency of the website. This also gives a satisfaction level to the users.

The result of the system evaluation was excellent because the system met the intended function in different aspects. For further improvement of Cavite PUV fare system, the researchers recommend that: (1) the mobile application must be promoted and advertised by the authorities such as the Land Transportation Franchising and Regulatory Board (LTFRB) to make sure that the mobile application will be used for awareness and safety purpose; (2) for the developed system, it is recommended to add or provide more interesting features for the convenience of the users such as lighter background color to be pleasing to the eyes of the user and some trivia or information regarding on the place the user wants to visit; (3) upgrade the mobile application into an offline based information system to be accessible to the commuters of the province without accessing to the internet; and (4) make the mobile application available not only for the android phone but also to all kinds of operating systems such as iOS and others.

LIST OF TABLES

Table	Page
1 Distribution of participants per cities/municipalities of Cavite	26
2 Identified problems of the study	31
3 Pareto analysis	34
4 Matrix data analysis	37
5 Likert scale for rating the respondents' statements.....	49
6 Descriptive level of mean	50
7 Guiding principles of the system in making specific actions	51
8 Guiding principles of the system does what is appropriate	51
9 Guiding principles of the system responses to user's actions.....	52
10 Workload of the system does not overload displays with excessive data.....	53
11 Workload of the system limiting the reading and shows concise items	54
12 Workload of the system limiting the reading and shows concise items	54
13 Workload of the system does not require item translations	55
14 Explicit control of the system processes only those actions requested by the users	56
15 Explicit control of the system is easy for the users to recover data in event of failure.....	57
16 Explicit control the user has the chance to review the content of the system...	58
17 Adaptability of the system was designed to match the needs of different users	59
18 Adaptability of the system can adapt to any devices	59
19 Error management of the system helps to prevent or reduce errors	60

20	Error management of the system allows the users to make corrections when needed	61
21	Error management of the system facilitates the user retrieval of data	62
22	Error management of the system by suggesting the reasons for their errors and showing them ways to avoid or solve the errors	62
23	Error management of the system do not occur without cause	63
24	Error messages in the system describe what action is needed	64
25	Error messages in the system can understand easily	65
26	Consistency of the display format of the system is consistent.....	66
27	Consistency of the label format in the system	66
28	The system is compatible to the needs of the user.....	67
29	The system has a good design and response compatibility between controls/actions.	68
30	The design of the system is compatible to some factors such as screen resolution, background, color, use of frames	69
31	The system is effective in finishing the desired task	70
32	The information needed in the system is easy to find.....	70
33	The system is free from unpredicted errors	71
34	The information in the system is clear and informative to the users.	72
35	The system does correctly what was proposed.....	73
36	The user can easily start and finish the program.....	74
37	The system has all the functions required for its execution.....	74
38	The system helps user to meet its intended goals in efficient time.....	75
39	The system was designed for various users	76
40	The system can accomplish the tasks more quickly	76
41	The system promotes good user experience	77

42 Overall, the system is very satisfying and easy to use.....78

An undergraduate thesis presented to the faculty of the Department of Industrial Engineering and Technology, College of Engineering and Information Technology, Cavite State University, Indang, Cavite. In partial fulfillment of the requirements for the degree of Bachelor of Science in Industrial Engineering with Contribution No. CEIT 2018-19-2-017. Prepared under the supervision of Engr. Gerry M. Castillo.

INTRODUCTION

Cavite is a province in the Philippines located on the CALABARZON region in Luzon Island. According to Philippine Statistics Authority (2015), the total population of the province was 3,678,301 and classified as one of the most industrialized and fastest growing provinces.

According to the National Statistics Office (2013), Cavite is an area most often visited by local and foreign visitors. It is the second most frequently visited place after National Capital Region (NCR). The number of visitors in the area continued to increase, particularly during summer months when both domestic travel and foreign tourist arrival are at peak.

As studied by Adrian (2017), whether commuters or the public transport operators like it or not, change is upon the transportation scene in the Philippines. The awful traffic
