A B S T R A C T

The study, "Analysis of Egg Production Record of the DSAC Poultry Project from 1978-1980," was made to determine the amount and the cost of feeds needed to produce a dozen eggs. It was conducted from January to March 1981 at the DSAC Layer Project, Indang, Cavite covering a period of three years with an average of ten laying months.

The average egg production was highest in 1979 with 70.95%, followed by 1980 with 70.08% and in 1978 with 65.74%.

The average amount of feeds consumed to produce a dozen eggs was lowest in 1980 with 1.93 kilograms followed by 1.99 kilograms in 1979 and 2.05 kilograms in 1978.

The average cost to produce a dozen eggs was highest in 1980 with ₱3.86 followed by ₱3.62 in 1979 and ₱3.52 in 1978.

The average net labor income per dozen eggs was highest in 1980 with ₱3.52, followed by ₱2.98 in 1979, and ₱2.48 in 1978.

1/ A Special Problem presented to the faculty of the Don Severino Agricultural College, Indang, Cavite, in partial fulfillment of the requirements for graduation with the degree of Bachelor of Science in Agriculture (BSA), Major in Animal Husbandry. Contribution No. AS 81090-010 conducted in the Department of Animal Science under the supervision of Mr. Apolinar A. Umali.

INTRODUCTION

Feed efficiency is one of the indicators in determining the performance of layers in layer management. The amount of feeds consumed would highly affect the cost and return of a poultry project. This being so, a caretaker has to be very careful in the selection and in determining the amount of feeds to be fed to the birds.

Importance of the Study

Most of the time the cost of feeds goes up. If a caretaker is not careful in feeding the birds a lot of waste will ensue. There has to be a study, therefore, to determine the amount of feeds to be fed to the birds to produce a dozen eggs. The result of this study will be of great help to poultry raisers for it will give them an idea of how
