## ABSTRACT

**DIMERO, JOHN BENEDICT T., PEREY, JOHN JAHAZIEL R., VEDAN III, WILFREDO V. Mosquito Repellent Candle from Neem Tree and Indian Tree Leaves.** Research Study. Science High School, College of Education, Cavite State University, Indang, Cavite. April 2013. Adviser: Mrs. Momed A. Callao.

This research study was conducted in Amadeo, Cavite and Indang, Cavite from December 2012 to January 2013 in order to produce mosquito repellent candle using indian tree and neem tree extracts; determine the physical properties of the produced candles; and evaluate the effectiveness of the candle. The study also analyzed the presence of phytochemicals in both Neem and Indian tree leaves.

This study was conducted in Randomized Complete Block Design (RCBD) with four treatments replicated four times. The treatments used were T<sub>0</sub>- control; T<sub>1</sub>- 150 g of paraffin wax, 7 grams of neem tree leaves and 3 grams of indian tree leaves; T<sub>2</sub>- 150 g of paraffin wax, 5 grams of neem tree leaves and 5 grams of indian tree leaves; T<sub>3</sub>- 150 g of paraffin wax, 3 grams of neem tree leaves and 7 grams of indian tree leaves.

It was revealed that treatment 2 is the best treatment of all in terms of odor according to the respondents' choice. In terms of color, treatment 0 ranked first. Treatment 1 is the best among all the treatments in terms of texture. All treatments in terms of general acceptability were preferred by the respondents and was rated as moderately acceptable.

Treatment 1 was observed to be the best among all treatments in terms of effectiveness. But among all treatments, only treatment 0 appeared to be ineffective.

## INTRODUCTION

Insects are the most abundant forms of animal life on earth. They are found almost everywhere on earth and destined to remain here even after 250 million years (Sanosafe, 1984; Beaño Cordez, and Ronio, 2005).

Insects may be harmful and can cause great economical losses by damaging valuable plants, spreading diseases, and sometimes death to both human and animals. A mosquito is an example of this kind of insect.

Mosquitoes are small delicate two-winged flies. Several species are carriers of disease such as malaria, filariasis, dog earthworm, arbovial encephalitis, and yellow fever. These harmful insects are found everywhere on earth except in the ice bound areas with deviation of 12-14 thousand feet. Their vast multiplication is influenced by environmental factors such as light, temperature, and humidity. *Aedes aegypti* is a kind of mosquito that brings diseases (Demaunahan, 1994).
