## ABSTRACT

The study, Production of Sweet Corn Fertilized with Complete Fertilizer was conducted from October 2, 1986 to December 26, 1986 at the Experimental Field of the Don Severino Agricultural College. The objectives were: to gain experience through actual exposure in managing a corn plantation and to determine the cost and return of cultivating this crop.

An area of 5,000 square meters was used for corn production and was prepared by plowing and harrowing at an interval of two weeks. Planting was done on October 2, 1986.

The ring method of fertilizer application was used. One-half of the total amount of complete fertilizer was applied during the planting time and the other half was applied when the plants were almost knee high.

Harvesting was done at exactly 118 days after planting followed by selection of marketable and non-marketable ears of corn for market disposal.
