ABSTRACT

DAYMON, IVAN N., and RESURRECCION, JONAREX G. Design and Development of 3-D Visualization of College of Education. Undergraduate Thesis Bachelor of Science in Information Technology, Cavite State University, Indang, Cavite October 2012. Adviser: Mr. Michael Jeffrey Añonuevo.

The 3-D Visualization of College of Education was developed to help the students and visitors to navigate the College of Education through 3-dimensional system and help to gain all information about the college and the university such as history, mission, vision and goals, teacher's profile and events in the college.

The researchers used the Prototyping Methodology as a paradigm in the development of the system. Prototyping Methodology consists of the following phases: Planning Phase, Analysis Phase, Design Phase, Implementation, System Prototype, Implementation Phase and Software Deployment.

The 3-D Visualization of College of Education was developed under Google Sketch-up for developing 3-D environment, Microsoft Visual Basic was used for the backbone of the system, Microsoft Access for the database and Unity in rendering the 3-D environment. Microsoft Visio 2003 for designing the diagram, Adobe Photoshop and Flash were integrated as part of the software for the design, animation, interface and Microsoft Office Word 2010 for the documentation.

DESIGN AND DEVELOPMENT OF 3-D VISUALIZATION OF COLLEGE OF EDUCATION

**Ivan N. Daymon
Jonarex G. Resurreccion**

An undergraduate thesis manuscript submitted to the faculty of the Department of Information Technology, College of Engineering and Information Technology, Cavite State University, Indang, Cavite in partial fulfillment of the requirements for the degree of Bachelor of Science in Information Technology. Contribution No. CEIT 11-12-013 Prepared under the supervision of Mr. Michael Jeffrey Añonuevo

INTRODUCTION

Most of us have played a 3-D game before, be it on a PC, a game console or other gaming devices. However, most of us don't really know how a 3-D scene is created, and certainly don't have to know it in order to enjoy playing 3-D games.

If we compare 3-D graphics with the real world, the real world has the advantage of being infinite in size and detailed. Obviously, computing devices can only store and process a limited amount of data. So when attempting to model the real world, shortcuts are needed to be taken and if you look closely enough at any digitized picture, you will see flaws that are not visible in the real world.

According to Rene Froeleke, in order to maximize the level of detail while minimizing the amount of data to be stored and processed, the world is broken down into a set of objects which make up the 3-D scene. These objects are then broken down into a set of building blocks that are known as primitives. The most used 3-D primitives are
