## ABSTRACT

This hog fattening project was conducted at the piggery project of the Don Severino Agricultural College, Indang, Cavite, to harness the student entrepreneurial skills and to gain supervisory and managerial experience preparatory for actual future job.

Twelve weanlings were used in this project. The animals were assured to be free from any disease and weighed 13.83 kgs. on the average.

Aside from the average final body weight, feed consumption of the hogs were lower than the projected. A relatively good feed conversion efficiency was realized.

A net income of P 6,709.48 was realized at the end of the feeding period.

Actual operation of the project provided the student the experience in making important management decisions relative to the success of the project.
