LIST OF TABLES

Table	Title	Page
	Isolation and Culture of Protoplasts from <i>Kappaphycus alvarezii</i>	
1.1	Gross morphological characteristics of the three cultivars of <i>K. alvarezii</i> collected from a seaweed seedbank in Bohol, Philippines.	11
1.2	Commercial enzyme preparations tested for production of protoplasts from <i>K. alvarezii</i> tissues.	17
1.3	Characteristics of tissues subjected to different surface sterilization procedures.	24
1.4	Growth rate (% day ⁻¹) of axenic tissues of <i>K. alvarezii</i> cultured for 15 days in F/2 with or without antibiotics at 24±1°C, 12L:12D photoperiod and 20 µmol photons m ⁻² s ⁻¹ .	25
1.5	Germination rate (%) and filament length (mm) of protoplasts from apical tissues of <i>K. alvarezii</i> (KaL) after 20 days of culture in various media at different temperature and irradiance levels and at 12L:12D photoperiod.	39
	Isolation and culture of Vegetative Cells of <i>Kappaphycus alvarezii</i>	
2.1	Specific growth rate (% day ⁻¹) of <i>K. alvarezii</i> (KaG) cells after 34 days of culture at 24±1°C, at various irradiance and photoperiod in culture media enriched with varying levels of Indole-3 butyric acid levels (IBA).	59
2.2	Filament length (mm) of germlings from <i>K. alvarezii</i> (KaG) cells cultured for 77 days at 24±1°C, at various irradiance and photoperiod in culture media enriched with varying levels of IBA.	61

LIST OF FIGURES

Figure	Title	Page
	Isolation and Culture of Protoplasts from <i>Kappaphycus alvarezii</i>	
1.1	Cultivars of <i>K. alvarezii</i> collected from Bohol, Philippines: A) KaG = <i>K. alvarezii</i> cultivar M, giant; B) KaL= <i>K. alvarezii</i> cultivar L; and C) KaBu = <i>K.alvarezii</i> , native cultivar locally known as “Bisaya” . Identification based on Trono et al. (2000). (Scale bar=31.54mm)	10
1.2	<i>K. alvarezii</i> (KaG) tissue (A) treated with enzyme showing cell (arrow) about to be released as protoplast. (Scale bar = 149 μ m)	27
1.3	“ Peeling off” of the cell wall (arrow) of <i>K. alvarezii</i> (KaG) cell. (Scale bar= 500 μ m).	27
1.4	Protoplasts of <i>K. alvarezii</i> (KaG) stained in Evan’s blue, protoplasts attached to debris (A), shapes ranged from spindle-shaped (B) to spherical (C). Deeply stained single cell (D). (Scale bar = 149 μ m).	28
1.5	Yield (no. g ⁻¹ tissue) of viable protoplasts from tissues of the middle segments of <i>K. alvarezii</i> (KaG) treated with commercial enzyme preparations for 24 h at three temperature levels. AAP= Abalone Acetone Powder, Cel=Cellulase, EP1 =2% Cel, EP2=5%Cel, EP3 = 2% AAP, EP4= 5%AAP, EP5=2%AAP+2% Cel, EP6 = 5% AAP+ 2% Cel, EP7= 2% AAP+5%Cel, EP8=5%AAP+5% Cel, SSW= sterile seawater. (Yields with similar superscripts do not differ significantly P=0.05).	29
1.6	Yield (no. g ⁻¹ tissue, x10 ³) of viable protoplasts from tissues of the middle segments of <i>K. alvarezii</i> (KaG) treated for 16 h at 24 \pm 1°C with enzyme preparations mixed with different types and concentrations of osmotica. EP3 = 2% AAP, EP4 = 5% AAP, EP6 = 5% AAP + 2% Cel, EP7=2%AAP+5%Cel. (Differences between yields with similar superscripts are not significant, P=0.05).	31

LIST OF FIGURES

Figure	Title	Page
1.7	Unviable protoplast from tissues of <i>K. alvarezii</i> (KaG) characterized by rupture of cell and very deep blue hue due to absorption of the Evan's blue stain.(Scale bar=149 μ m).	32
1.8	Yield (no. g^{-1} tissue) of viable protoplasts from tissues of the middle segments of <i>K. alvarezii</i> cultivars treated with commercial and fresh enzyme extracts for 24 h at $24 \pm 1^{\circ}C$. (Differences between yields with similar superscripts are not significant, $P=0.05$)	33
1.9	Yield (no. g^{-1} tissue, $\times 10^3$) of protoplasts from tissues of the middle segments of the three cultivars of <i>K. alvarezii</i> treated with fresh crude enzyme extracts at different duration of enzyme treatment at $24 \pm 1^{\circ}C$.	34
1.10	Yield (no. g^{-1} tissue, $\times 10^3$) of protoplasts from tissues of the middle segments of three <i>K. alvarezii</i> cultivars treated with fresh enzyme extracts at different pH levels for 32 h at $24 \pm 1^{\circ}C$. FAE= fresh abalone extract, GSE= terrestrial snail extract. (Differences between yields with similar superscripts are not significant, $P=0.05$).	36
1.11	Yield (no. g^{-1} tissue, $\times 10^3$) of protoplasts from tissues obtained from different thallus segments of three cultivars of <i>K. alvarezii</i> treated with fresh enzyme extracts for 32h at $24 \pm 1^{\circ}C$. (Differences between yield with similar superscripts are not significant, $P=0.05$).	37
	Isolation and Culture of Vegetative Cells of <i>Kappaphycus alvarezii</i>	
2.1	Germinating <i>K. alvarezii</i> (KaG) cells (broken arrows), filaments (solid arrows) emerging from brownish buds at one pole of cells (A), filaments radiating from a germinating disk (B), and overlapping filaments (C). (Scale bar=149 μ m).	57
2.2	Filaments (arrows) arising from <i>K. alvarezii</i> (KaG) cells cultured in F/2 (A) and in SSW (B) enriched with 4ppm IBA. (Scale bar=149 μ m).	57

LIST OF FIGURES

Figure	Title	Page
2.3	Germination rate (%) of cells from middle segment of <i>K. alvarezii</i> (KaG) cultured at $24\pm 1^{\circ}\text{C}$, $60\mu\text{mol photons m}^{-2} \text{s}^{-1}$ and 12L:12D photoperiod in F/2 and SSW enriched with different Indole-3 butyric levels (IBA) levels.	58
2.4	Filament length (mm) of <i>K. alvarezii</i> (KaG) germlings cultured for 43 days at $24\pm 1^{\circ}\text{C}$, $60 \mu\text{mol photons m}^{-2} \text{s}^{-1}$ in F/2 and SSW enriched with different IBA levels.	58
2.5	Germination rate (%) of vegetative cells from different thallus segments of three <i>K. alvarezii</i> cultivars after 20 days of culture in various media at $24\pm 1^{\circ}\text{C}$, 14L:10D photoperiod and at $20\mu\text{mol photons m}^{-2} \text{s}^{-1}$. AS = apical segment, MS = middle segment, BS = basal segment	62
2.6	Germination rate (%) of cortical and medullary cells isolated from the apical segment of <i>K. alvarezii</i> (KaL) using three methods and cultured at different temperature levels for 15 days in F/4 at $20 \mu\text{mol photons m}^{-2} \text{s}^{-1}$ and at 14L:10D photoperiod. A= cells dissociated from softened thalli, B= dissociated from fresh thalli, C= dissociated by heating.	63
2.7	Filament length (mm) of germlings from different cell types of the apical region of <i>K. alvarezii</i> (KaL) after 20 days of culture in F/4 (+ 4ppm IBA) at different temperature levels.	64

LIST OF APPENDICES

Appendix Table No.	Title	Page
	Isolation and Culture of Protoplasts of <i>Kappaphycus alvarezii</i>	
A	Test of homogeneity of variances and Univariate ANOVA of data from experiments on isolation and culture of protoplasts and vegetative cells of <i>K. alvarezii</i>	79
1.1a	Protoplast yield (no. g ⁻¹ tissue) from tissues of middle segments of <i>K. alvarezii</i> (KaG) treated with different commercial enzyme preparations for 24h at three temperature levels.	82
1.1b	Logarithmic transformation of data on protoplast yield (no. g ⁻¹ tissue) from tissues of middle segments of <i>K. alvarezii</i> (KaG) treated with different commercial enzyme preparations for 24h at three temperature levels.	84
1.1c	Duncan's Multiple Range Test (DMRT) on protoplast yield (no. g ⁻¹ tissue) from tissues of middle segments of <i>K. alvarezii</i> (KaG) treated with different commercial enzyme preparations for 24h at three temperature levels.	86
1.2a	Protoplast yield (no g ⁻¹ tissue) from tissues of middle segments of <i>K. alvarezii</i> (KaG) treated for 16h at 24±1°C with enzyme preparations mixed with different types and concentrations of osmotica.	87
1.2b	Logarithmic transformation of protoplast yield (no g ⁻¹ tissue) from tissues of middle segments of <i>K. alvarezii</i> (KaG) treated for 16h at 24 ±1°C with enzyme preparations mixed with different types and concentrations of osmotica	88
1.2c	DMRT on protoplast yield (no g ⁻¹ tissue) from tissues of middle segments of <i>K. alvarezii</i> (KaG) treated for 16h at 24 ±1°C with enzyme preparations mixed with different types and concentrations of osmotica.	89

LIST OF APPENDICES

Appendix Table No.	Title	Page
1.3a	Protoplast yield (no g ⁻¹ tissue) from tissues of the middle segments of three <i>K. alvarezii</i> cultivars treated with commercial and fresh crude enzyme extracts for 24h at 24± 1°C.	90
1.3b	Logarithmic transformation of protoplast yield (no g ⁻¹ tissue) from tissues of the middle segments of three <i>K. alvarezii</i> cultivars treated with commercial and fresh crude enzyme extracts for 24h at 24± 1°C.	91
1.3c	DMRT on protoplast yield (no g ⁻¹ tissue) from tissues of the middle segments of three <i>K. alvarezii</i> cultivars treated with commercial and fresh crude enzyme extracts for 24h at 24± 1°C	91
1.4a	Yield (no. g ⁻¹ tissue) of protoplasts from tissues of the middle segments of three <i>K. alvarezii</i> cultivars treated with fresh abalone and GSE enzyme extracts at different duration and at 24±1°C.	92
1.4b	Logarithmic transformation of data on protoplast yields (no. g ⁻¹ tissue) from tissues of three <i>K. alvarezii</i> cultivars treated with fresh abalone and GSE enzyme extracts at different duration of treatment and at 24±1°C.	94
1.4c	DMRT on protoplast yield (no. g ⁻¹ tissue) from tissues of the middle segments of three <i>K. alvarezii</i> cultivars treated with fresh abalone and GSE enzyme extracts at different duration and at 24±1°C.	96
1.5a	Yield (no g ⁻¹ tissue) of protoplasts from tissues of the middle segments of three <i>K. alvarezii</i> cultivars treated with fresh crude enzyme extracts at different pH levels for 32 h at 24±1°C.	97
1.5b	Logarithmic transformation of data on protoplast yield (no g ⁻¹ tissue) from middle segments of three <i>K. alvarezii</i> cultivars treated with fresh crude enzyme extracts at different pH levels for 32 h at 24±1°C.	99

LIST OF APPENDICES

Appendix Table No.	Title	Page
1.5c	DMRT on protoplast yield (no g ⁻¹ tissue) from middle segments of three <i>K. alvarezii</i> cultivars treated with fresh crude enzyme extracts at different pH levels for 32 h at 24±1°C.	101
1.6a	Yield (no. g ⁻¹ tissue) of protoplasts from tissues obtained from different thallus segments of three <i>K. alvarezii</i> cultivars treated with fresh enzyme extracts for 32h at 24±1°C.	102
1.6b	Logarithmic transformation of data on protoplast yield (no. g ⁻¹ tissue) from tissues obtained from different thallus segments of three <i>K. alvarezii</i> cultivars treated with fresh enzyme extracts for 32h at 24±1°C.	103
1.6c	DMRT on protoplast yield of (no. g ⁻¹ tissue) from tissues obtained from different thallus segments of three <i>K. alvarezii</i> cultivars treated with fresh enzyme extracts for 32h at 24±1°C.	104
1.7a	Germination rate (%) of protoplasts isolated from apical segment of <i>K. alvarezii</i> (KaL) cultured in various culture media at different temperature and irradiance levels.	105
1.7b	DMRT on germination rate (%) of protoplasts isolated from apical segment of <i>K. alvarezii</i> (KaL) cultured in various culture media at different temperature and irradiance levels	107
1.8a	Filament length (mm) of protoplasts isolated from apical segment of <i>K. alvarezii</i> (KaL) cultured in various media at different temperature and irradiance levels	108
1.8b	DMRT on filament length (mm) of protoplasts isolated from apical segment of <i>K. alvarezii</i> (KaL) cultured in various media at different temperature and irradiance levels	110

LIST OF APPENDICES

Appendix Table No.	Title	Page
	Isolation and culture of Vegetative Cells of <i>Kappaphycus alvarezii</i>	
2.1a	Germination rate (%) of cells from middle segments of <i>K. alvarezii</i> (KaG) cultured at $24\pm 1^{\circ}\text{C}$, $60\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$ and 12L:12D photoperiod in F/2 and SSW enriched with different levels of IBA	111
2.1b	Square-root transformation of data on germination rate (%) of cells from middle segments of <i>K. alvarezii</i> (KaG) cultured at $24\pm 1^{\circ}\text{C}$, $60\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$ and 12L:12D photoperiod in F/2 and SSW enriched with different levels of IBA	111
2.1c	DMRT of data on germination rates (%) of cells from middle segments of <i>K. alvarezii</i> (KaG) cultured at $24\pm 1^{\circ}\text{C}$, $60\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$ and 12L:12D photoperiod in F/2 and SSW enriched with different levels of IBA	112
2.2a	Filament length (mm) of <i>K. alvarezii</i> (KaG) germlings cultured for 43 days at $60\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$ and $24\pm 1^{\circ}\text{C}$ in media enriched with different levels of IBA	113
2.2b	DMRT of data on filament length (mm) of <i>K. alvarezii</i> (KaG) germlings cultured for 43 days at $60\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$ and $24\pm 1^{\circ}\text{C}$ in media enriched with different levels of IBA.	114
2.3a	Specific growth rate (% day ⁻¹) of <i>K. alvarezii</i> (KaG) cells after 34 days of culture at $24\pm 1^{\circ}\text{C}$, at various irradiance levels and photoperiod in culture media enriched with different levels of IBA.	115
2.3b	DMRT on specific growth rate (% day ⁻¹) of <i>K. alvarezii</i> (KaG) cells after 34 days of culture at $24\pm 1^{\circ}\text{C}$, at various irradiance levels and photoperiod in culture media enriched with different levels of IBA.	117
2.4a	Germination rate (%) of <i>K. alvarezii</i> cells isolated from different thallus age/segment and cultured for 20 days in different media at $24\pm 1^{\circ}\text{C}$, 14L: 10D photoperiod and at $20\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$.	118

LIST OF APPENDICES

Appendix Table No.	Title	Page
2.4b	Square-root transformation of data on germination rate (%) of <i>K. alvarezii</i> cells isolated from different thallus age/segment cultured for 20 days in different media at $24\pm1^{\circ}\text{C}$, 14L:10D photoperiod and at $20\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$.	120
2.4c	DMRT on germination rate (%) of <i>K. alvarezii</i> cells isolated from different thallus age/segment cultured for 20 days in different culture media for 20 days in different media at $24\pm1^{\circ}\text{C}$, 14L: 10D photoperiod and at $20\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$.	122
2.5a	Germination rate (%) of cortical and medullary cells obtained from apical segment of <i>K. alvarezii</i> (KaL) using different isolation methods and cultured at different temperature levels for 15 days in F/4 at 14L:10D photoperiod and at $20\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$.	123
2.5b	Square-root transformation of data on germination rate (%) of cortical and medullary cells obtained from apical segment of <i>K. alvarezii</i> (KaL) using different isolation methods and cultured at different temperature levels for 15 days in F/4 at 14L:10D photoperiod and at $20\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$.	124
2.6a	Filament length (mm) of germlings from cortical and medullary cells obtained from apical segment of <i>K. alvarezii</i> (KaL) using different isolation methods and cultured at different temperature levels for 20 days in F/4 at 14L: 10D photoperiod and at $20\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$.	125
2.6b	Square-root transformation of filament length (mm) of germlings from cortical and medullary cells obtained from apical segment of <i>K. alvarezii</i> (KaL) using different isolation methods and cultured at different temperature levels for 20 days in F/4 at 14L: 10D photoperiod and at $20\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$.	126
2.6c	DMRT on filament length (mm) of germlings from cortical and medullary cells obtained from apical segment of <i>K. alvarezii</i> (KaL) using different isolation methods and cultured at different temperature levels for 20 days in F/4 at 14L: 10D photoperiod and at $20\ \mu\text{mol photons m}^{-2}\text{ s}^{-1}$.	127

CHAPTER I

GENERAL INTRODUCTION

The commercial farming of carrageenophytes belonging to the genus *Kappaphycus* began in the Philippines in the early 1970's. About three decades after, the industry had become one of the country's largest fisheries exporters involving about 180,000 families, approximately 47,000 ha. farming areas, 13 processors and ten exporters (Guerrero, 1999; Buendia, 1998; Hurtado and Cheney, 2003). The highest seaweed producing areas are the Sulu Archipelago in Western Mindanao, Central Visayas and the Southern Tagalog regions.

There are four species of *Kappaphycus* present in the Philippines and two of these - *K. alvarezii* and *K. striatum* - are cultured in large-scale. Because the former is easier to grow, it has supplanted the latter which was the dominant cultivated species in previous years (Lobban and Harrison, 1994). Morphologically, *K. alvarezii* is characterized by smooth branch surfaces, large, fleshy, cartilaginous and cylindrical thalli with group of apical cells at tip of branches (Trono, 1997). Referred to by a number of colloquial names such as the "cottonii" types and "tambalang", *K. alvarezii* was formerly placed under the genus *Eucheuma*. Presently, it is taxonomically classified as *Kappaphycus* because of its distinct type of carrageenan (Doty, 1988).

The main by-product from *Kappaphycus* is κ - carrageenan, a hard-gelling colloid, which has multitudes of applications in food and non-food industries. In 1994, when
